IPsyNet Statement on LGBTIQ+ Concern
IPsyNet Statement and Commitment

We acknowledge, as subscribers to the principle that human rights are universal, that all human beings are worthy of dignity and respect, including respect for diversity on the basis of sexual orientation, gender identity and gender expression, or differences in sex development. We believe that discrimination and psychological maltreatment are not consistent with international human rights aspirations (Universal Declaration of Ethical Principles for Psychologists, 2008). We actively support the development of and support for LGBTIQ+ affirmative and inclusive treatment as well as service provision.

We concur that psychology as a science and a profession has expertise based on decades of research demonstrating that LGBTIQ+ identities and expressions are normal and healthy variations of human functioning and relationships. For example, as set out in the ICD-10 (World Health Organization, 1990, p. 11), homosexuality is not a diagnosable mental disorder. We actively challenge claims made by political, scientific, religious, or other groups that claim or profess that LGBTIQ+ identities, expressions, and sex characteristics are abnormal or unhealthy.

As LGBTIQ+ identities and orientations are normative variations of human experience and are not diagnosable mental disorders per se, they do not require therapeutic interventions to change them. Given that conversion therapies actively stigmatize same-sex orientations and transgender identities, as well as have the potential for harm, we support affirmative approaches to therapy for LGBTQ+ people and reject therapies that aim to cause harm to LGBTIQ+ people.

Transgender and gender nonconforming individuals have the right to live according to their gender identity and to access medical, psychotherapeutic, and social support as needed. This support should be offered irrespective of whether the person has a binary or nonbinary gender identity and whether they seek access to social or medical transition or one, several, or all treatments available. We furthermore support the full autonomy of transgender and gender nonconforming individuals in affirming their gender identities. Affirmative psychological support may be beneficial to their identity development and decision-making regarding social and medical transition (Coleman et al., 2012). We strongly oppose regulations forcing transgender and gender nonconforming individuals to undergo sterilization, divorce, or other procedures that might have stigmatizing or mentally, physically, or socially harmful effects in order to access desired transition supports. We affirm that transgender and gender nonconforming individuals have the right to define their identities as well as to decide on and access affirmative and transition-related health care as desired (Yogyakarta Principles, 2007).

Some LGBTIQ+ people may experience psychological distress because of the impact of social stigma and prejudice against LGBTIQ+ people in general or their individual identity within the LGBTIQ+ spectrum. LGBTIQ+ individuals with nonmonosexual (e.g., bisexual, pansexual) and non-cis identities (e.g., trans, nonbinary, agender), as well as LGBTIQ+ individuals with intersectional minority identities (e.g., based on race, ethnicity, disability, religion, gender, social class), may be especially at risk for minority stress, discrimination, both within and outside the LGBTIQ+ population, and resultant psychological difficulties. We condemn discrimination on the basis of intersecting minority identities within and beyond the LGBTIQ+ population. We furthermore actively support psychological research and practice that fully consider the intersectionality of LGBTIQ+ identities with others’ identities such as ethnicity, social class, and religion.

Efforts to repathologize LGBTIQ+ orientations, identities, or people by linking them to poor mental health misconstrue the effects of stigmatization and environmental hostility as inherent to LGBTIQ+ sexual orientations, gen-
under identities and expressions, or biological variance. We advocate for the removal of the stigma of psychopathology from LGBTIQ+ identities and expressions and oppose the misuse of research on health inequalities faced by LGBTIQ+ people that seek to misinform the public and attempt to reopathologize LGBTIQ+ people.

Psychologists’ lack of information and misinformation about LGBTIQ+ people and identities can perpetuate discrimination, stereotyping, and the potential for physical and mental health abuse. We advocate for the inclusion of LGBTIQ+ people as experts and as active, equal partners in research and policy development for research and policy initiatives that concern them. We support the development of psychological research and education that is not hetero- or cis-normative (e.g., Clarke, Ellis, Peel, & Riggs, 2010). Moreover, we provide psychological knowledge to psychological networks, organizations, policymakers, the media, and the public. Finally, on the basis of scientifically grounded knowledge, we advocate for greater awareness of the health and well-being needs of LGBTIQ+ people to improve public policy and LGBTIQ+ communities.
